

# Regenerative Real Estate, Diablo Canyon, Arizona

What if we imagined human development as a positive, rather than negative, influence on ecological systems? This project, created while I was a graduate student, envisioned a modular development along the edge of a degraded canyon. Modular housing units were designed to lodge on the rock shelves, while the cut stone created check dams to increase water infiltration during flash floods. The number of units and their arrangement across the property was designed to harvest rain water.
